

ABSTRACT

Techniques are provided for object management. In certain implementations, object management includes determining whether a signal representing the presence of at least one object to be monitored has been received and determining whether a signal representing the state of at least one object to be monitored has been received. If a signal representing the presence of at least one object to be monitored has been received, a determination is made as to whether a predetermined quantity of objects is present. If a signal representing the state of at least one object to be monitored has been received, a determination is made as to whether at least one object has a predetermined state.
